RASA TRAVEL AGENT FACTORY
NEW YORK · 3 NOVEMBER 2026

Your setup, in *eight* steps

0 Bring three things

Laptop with Chrome, headphones with a mic, a GitHub account (free: github.com/signup).

1 Get your Rasa licence

Request it at rasa.community/#request-license. The email takes a few minutes, so start here. Copy the whole string.

2 Get your OpenAI key

Ask the Rasa team for one. We hand out the keys at the workshop. Copy yours and keep it private.

3 Get your Deepgram key

Sign up or log in at console.deepgram.com. **Settings → API Keys → Create a New API Key**. Copy it.

4 Save all three on GitHub

github.com/settings/codespaces → **New secret**. Name, value, **Add secret**. Three times:

`RASA_LICENSE` · `OPENAI_API_KEY` · `DEEPGRAM_API_KEY`

In **Repository access**, type **rasa-community-resources** and pick **RasaHQ/rasa-community-resources**.

5 Open the workshop

Scan the code, or open github.com/RasaHQ/rasa-community-resources and click the Codespace link. Pick **Rasa Travel Agent Factory**, **4-core**, **Create codespace**.

`YOU SEE` Travel factory dependencies ready.

github.com/RasaHQ/rasa-community-resources

6 Check your keys

Terminal → New Terminal. Type `bash desk doctor`, press Enter.

`YOU SEE` three names, each present.

7 Your first win

Type `bash desk data fx USD GBP 200`, press Enter.

`YOU SEE` converted and reference_date.

`STUCK?`

A name says **missing**: fix its spelling or Repository access in step 4. Then github.com/codespaces → … → **Stop codespace**, reopen it, rerun step 6. Anything else: raise your hand. The host gave you a value? Use it in that step. Full guide: the workshop README.
